

[Zend Server](#) has a component that adds functionality to PHP called “[Data cache](#)”. This component can cache data which is then accessible to other PHP processes.

Your mission is to write code that test thoroughly 2 of [data cache's api functions](#):

1. [zend\\_shm\\_cache\\_store](#)
2. [zend\\_shm\\_cache\\_fetch](#)

- Please write positive test cases in any scripting language like PHP, Python or perl (preferably PHP) or even in pseudo code.
- Please describe the negative test cases in words. No code is needed here.
- Our clients value their data so please make sure data is not corrupted

\* Bonus points will be given if your code is actually running on an installed Zend Server.

If you need more examples for using Data cache you can use the following link:

[http://files.zend.com/help/Zend-Server-6/zend-server.htm#working\\_with\\_the\\_data\\_cache.htm](http://files.zend.com/help/Zend-Server-6/zend-server.htm#working_with_the_data_cache.htm)
